pipelines for analyzing geospatial and text data and creating geospatial models. It includes server modules for creating and managing all layers and map outputs, as well as web mapping and geospatial analysis. The GIS . comes to the desktop as a native ArcGIS client in Windows and Macintosh operating systems, as well as in mobile devices, desktops, and web browsers. It also integrates with . and is now capable of running both natively and in a web-enabled GIS. The ArcGIS API for JavaScript works with all of the capabilities of the desktop version of ArcGIS in order to provide a desktop-grade experience. It is a 3D, cross-browser, and cross-platform Web 3D client . for . . The user interface is done entirely in JavaScript and HTML, with no server-side component. The ArcGIS API for Mobile (AGM) . provides an API for the . , allowing developers to use the tools provided in ArcGIS in their own apps for mobile devices. It integrates with the native . and . API to provide a rich user interface and data access for iOS, Android, and Windows phone and tablet devices. Why the New Design? [#Sec1] ===== The . goes back to its roots as a desktop, stand-alone GIS. When you first start using ArcGIS . , you are not and . view, or interact with data through a map, but you are . . The existing product design takes a step back and gives you a . map view, and a handful of controls that are not sufficient for people to do their work with GIS. To get you to switch to the desktop . , we moved the . map view and the . . along with the design of the . buttons, into a separate window and reorganized all of the controls to be in a single toolbar, along with the layers, . . and . panels. The . view now becomes the workspace you work in. You are still able to have your . and . view at the same time as the map view. This maintains the direct link to the . 82157476af
